# **From Vision to Reality: Czech H2 Backbone and its role in the emerging Hydrogen Economy**

Czech H2 Backbone Dialogue

Ondřej Šabata, Head of Hydrogen Readiness

5<sup>th</sup> November 2024

# Gas infrastructure will be pivotal to make (green) hydrogen economy viable in Europe

## H2 molecules vs. electrons

**Some CO2 intensive sectors are hard-to-abate with electrification**

- Industrial processes (ammonia, steel, methanol) or heavy-duty long-haul transport
- Already ~8 Mt/y (~265 TWh) consumed in EU

**Electrical T&D infrastructure by far not developed for a hypothetical full electrification scenario**

- Hundreds of GWs of new RES power would be needed in EU, doubling the current capacity

**Intermittent nature of renewable electricity sources will require a coupling medium such as H2 (P2G)**

- Batteries with system backup for minutes at max (at costs ~100 EUR/MWh el.), while gas infra for whole seasons (at ~10 EUR/MWh H2)

**H2 molecules will be required to support electrons**

## Location of (green) H2 production

**Green H2 needs low-cost RES electricity to be competitive, which is location specific**

- >50% of green H2 production costs is cost of input electricity from RES

***RES location can push green H2 production costs from as low as 2 EUR/kg in e.g. Southern Europe towards 8+ EUR/kg in Central Europe***

**H2 demand clusters are far from places suitable for low-cost RES el. production**

**Transporting H2 is much cheaper than transporting electrons**

- Foreseen German H2 pipeline backbone of 9ths km, 101GW feed-in capacity, and 19B EUR costs, compared with German SuedLink 4GW HVDC, 700km, and 10B EUR el. transmission project

**Electrolysis will be located in geo areas suitable for RES**

## Importance of gas pipelines

**There are ~200 ths km high-pressure transmission pipelines in Europe**

- Most of which can be repurposed for transporting H2

***Levelized costs of transporting 1 kg H2 per 1000 km could be as low as 0.10 EUR in repurposed pipelines***

**H2 Purity through (repurposed) pipelines could gradually increase from initial 98+% towards 99.5%**

- 99.5% is suitable for most demand cases except for mobility, where purification with costs <0.7 EUR/kg would be required

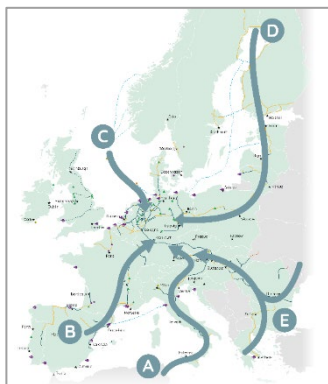

**Pipelines will be key to supply H2 demand centers in EU**

# Czechia (and N4G) have good prospects for participating in the emerging EU H2 economy

## Favorable geographical location of Czechia

CZ lies on the foreseen trans European H2 corridors

- 3 out of 5 corridors could utilize N4G assets
- But strong competition from alternative routes

CZ adjoins the approved German H2 core network

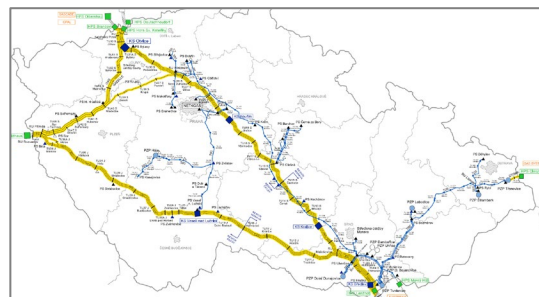

- ~9ths km of high-pressure pipelines to be operational by 2032
- Connection @ IPs Waidhaus & Deutschneudorf

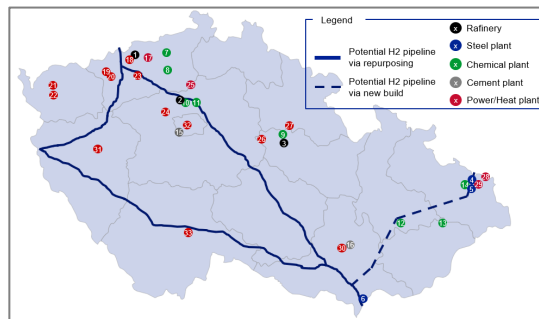

## Robust N4G infra in the vicinity of expected industrial demand

N4G has a robust transport infra to safely accommodate both future H2 and CH4 needs for decades to come

- 3 parallel high-capacity lines on most branches

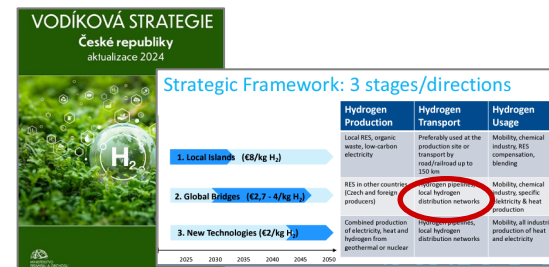

Many for H2 relevant Czech industries are placed along the N4G infra

## Strong political support within the Czech H2 Strategy framework

Czech H2 Strategy: Transport of H2 via the existing TSO infra is highlighted as one of key building blocks

Hydrogen as one of key strategic pathways for N4G under the state ownership

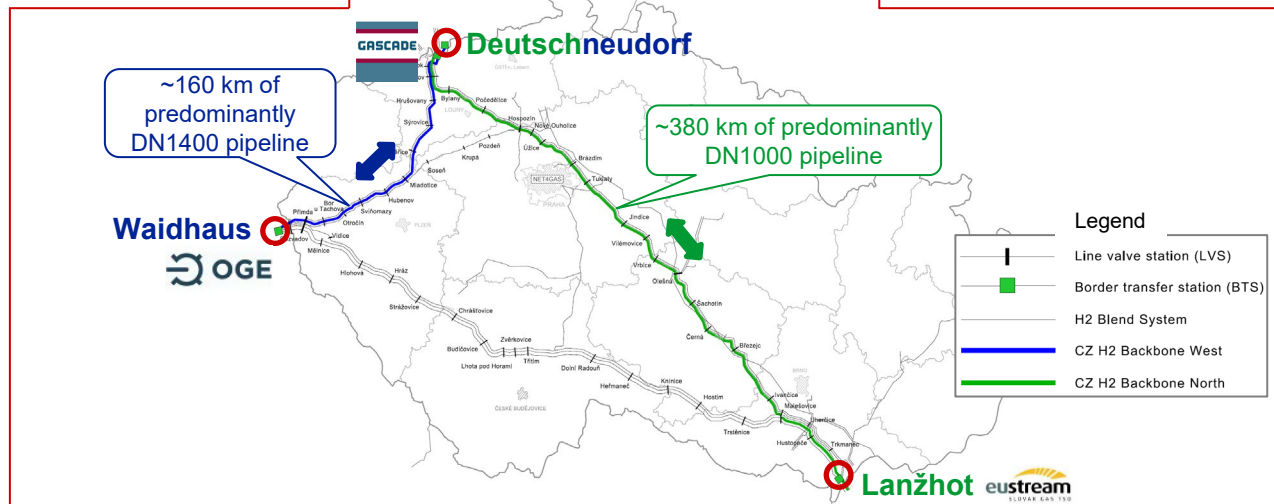

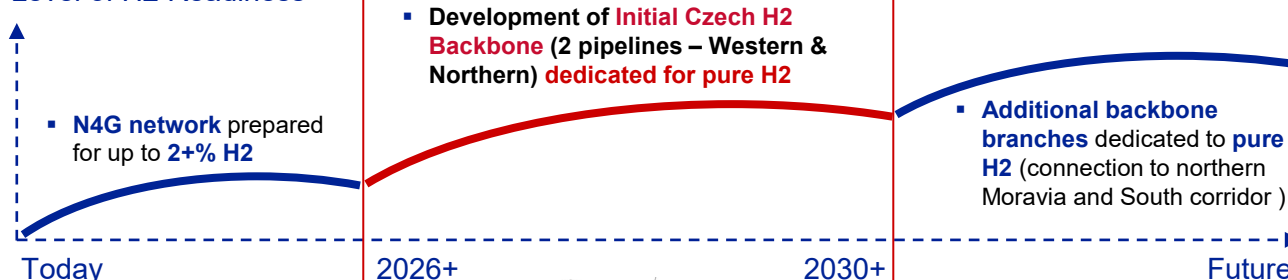

# N4G is working towards initial CZ H2 Backbone to connect 3 key cross border points by ~2030

## H2 mid-term vision (and a great starting position for Czechia)

## Comments

### Level of H2 Readiness

- **First dedicated N4G H2 corridors** expected to be made available via **repurposing** of existing infrastructure **~2030**
- Depending on demand development, regulatory regime, and financing scheme
- **Currently West and North corridors prioritized**, connecting 3 IPs (DND, LAN, WAID), with **shared starting capacity of 6GW** (144 GWh per day), **98+% H2 purity**, and expected **pressure** in the system at **30-40 bar**
- To-date results strongly support **viability of H2 retrofits** of existing N4G infrastructure **at reasonable costs**
- West with completed basic design phase and North with feasibility study

H2 corridors are currently being developed in dedicated projects together with other TSO partners

# NET4GAS is currently working on development of 4 international hydrogen transport corridors

**CEHC & CGHI included on 1<sup>st</sup> PCI/PMI H2 list**  
(from 51 applications<sup>1</sup> & 4 selected projects in HI East)

## Czech German Hydrogen Interconnector (CGHI)

- **Route:** 1068 km from the Baltic Sea and northern Germany to Czechia and southern Germany
- **Target capacity:** 144 GWh/d
- **Status:** FEED<sup>2</sup>
- **Start of operation:** 2030

## Central European Hydrogen Corridor (CEHC)

- **Route:** 1225 km from Ukraine to central Europe
- **Target capacity:** 144 GWh/d
- **Status:** Feasibility
- **Start of operation:** 2030+

## Sunshyne Corridor

- **Route:** ~3400 km from northern Africa to central Europe
- **Target capacity:** 144 GWh/d
- **Status:** Pre-feasibility
- **Start of operation:** 2030+

## South-East European Hydrogen Corridor (SEEHyC)

- **Route:** ~3000 km from the Balkans to central Europe
- **Target capacity:** 80+ GWh/d
- **Status:** Pre-feasibility
- **Start of operation:** 2030+

**NET4GAS aims to defend PCI status in the upcoming 2<sup>nd</sup> PCI round**

# Detailed technical concept for Czech H2 Backbone nearing finalization

CZ H2 backbone	Pure H2	Comments	Line pipes	Station pipes	Fittings	Flanges & gaskets	Valves	Other pipe material <sup>1</sup>	Sealants & lubricants	Volume measurement	Quality measurement	Compressor drives	Compressors	Compressor accessories <sup>2</sup>	Other technology <sup>3</sup>	Electrical equip. in EX zone	Gas/fire detection systems <sup>4</sup>	EX & safety zones	Flow velocity / sizing <sup>5</sup>	Operations activities	Maintenance activities <sup>6</sup>	Work equipment
			<ul style="list-style-type: none"><li>By and large confirmed by material tests and Fracture Mechanical Assessments</li></ul>	<ul style="list-style-type: none"><li>Analogy to line pipes (but higher WT and no ILI) – to be confirmed by ext. evaluator; Excl. CS pipeyards</li></ul>	<ul style="list-style-type: none"><li>Pig-Sigs to be decommissioned due to non-compatibility of magnets</li><li>Current TDW fittings not suitable</li></ul>	<ul style="list-style-type: none"><li>Tight for NG = tight for H2</li><li>Some flange types will need to be resealed or removed (esp. on main line)</li></ul>	<ul style="list-style-type: none"><li>Some valves (e.g. w/o vent/docs) and GH actuators to be R; North corridor valves, bypasses and regulators WIP</li></ul>	<ul style="list-style-type: none"><li>Thermowells/annubars to be cancelled; Isolation couplings to be removed; Cleaning chambers mostly ok</li></ul>	<ul style="list-style-type: none"><li>All "suspicious" substances tested in a specialized German laboratory</li></ul>	<ul style="list-style-type: none"><li>Metering concept only in preparation</li><li>UT flow meters &amp; flow computers (after SW upgrade) likely suitable</li></ul>	<ul style="list-style-type: none"><li>Metering concept only in preparation</li><li>H2 quality standards only in prep</li></ul>	<ul style="list-style-type: none"><li>No need for compression on CZ H2 backbone in the initial phase</li></ul>	<ul style="list-style-type: none"><li>No need for compression on CZ H2 backbone in the initial phase</li></ul>	<ul style="list-style-type: none"><li>No need for compression on CZ H2 backbone in the initial phase</li></ul>	<ul style="list-style-type: none"><li>CP confirmed (but to be separated), filters ok with some changes &amp; existing TDW will not be usable</li></ul>	<ul style="list-style-type: none"><li>ATEX class IIA for NG is valid only up to 25% H2, but some equipment bought in IIC (for pure H2) already</li></ul>	<ul style="list-style-type: none"><li>Catalytic and electrochemical sensors OK; IR sensors not suitable</li></ul>	<ul style="list-style-type: none"><li>EX-zones to be increased ~2x by flanges and current safety zones unchanged</li></ul>	<ul style="list-style-type: none"><li>Velocities up to 40 m/s confirmed incl. abrasion; Some piping dimensions still to be verified</li></ul>	<ul style="list-style-type: none"><li>Effect on capacities / need for regulations understood; ILI mgmt., emergency plans etc. WIP</li></ul>	<ul style="list-style-type: none"><li>Changes by esp. larger gas releases (both planned and unplanned) towards nitrogen inertization</li></ul>	<ul style="list-style-type: none"><li>Personal detectors mostly ok; Work clothing compatible</li><li>Working procedures WIP</li></ul>

← H2 compatible

→ Not H2 compatible

Confirmed (by supplier / norm / testing)

Strong hypothesis

Needs further analysis

Strong hypothesis

Confirmed

R = Needs to be replaced    U = Partial upgrade

**CZ Backbone West: Basic design stage completed, Permit design phase to start**  
**CZ Backbone North: Feasibility study completed, Basic design stage to start**

# Biggest retrofit cost item is separation of H2 backbone pipelines from the rest of the network

## Key retrofit items for the foreseen CZ H2 Backbone

**Costs<sup>4</sup>**  
(relative to largest item)

### Separation of H2 backbone pipelines from rest of the network

- Redesign of main nodes (Lanzhot, Primda, Malesovice, Jirkov), upgrade of pigging chambers (old design and/or one-way), cut-off & capping of connection branches, diversification of DS connections, separation of cathodic protection

### Selective replacement of valves & resealing (or cancellation) of flanges

- Replacement of some valves (based on type, age, tightness, documentation), adjustment of LVS<sup>1</sup> bypasses, resealing of main flanges, cancellation of some flanged/screwed connections, replacement of GH<sup>2</sup> actuators, retrofit of control valves

### Replacement and strengthening of maintenance equipment

- Including mobile compressors & flares of different sizes, and nitrogen purging equipment – all with potential synergies with Decarb. project
- Extension of paved areas at line valve stations to accommodate the equipment

### Upgrade of commercial metering at border transfer stations

- Retrofit of Lanzhot's 2<sup>nd</sup> metering section for ~150+ GWh/d capacity (35bar & 35m/s)

### Cleaning & purging with nitrogen before conversion

- Includes 5 cleaning runs, natural gas recompression, nitrogen purging at 1 bara, and H2 first fill works

### Repair of individual pipes

- Repairs of pipes with higher wall thickness reduction – generally >20%

### Replacement of electrical equipment in EX zones, which is not in ATEX IIC class

- Upgrade of all relevant actuators, control and junction boxes assumed due to extension of EX zones and increased requirement for ATEX
- Relocation of some lighting poles

### Replacement of devices affected by potential vibrations stemming from higher flow velocities

- All annubars, thermowells and remaining pig-sigs to be replaced

Capex per retrofitted km estimated ~1/3 of western European benchmarks<sup>3</sup>, and <1/10 compared to newbuild

# Tight repurposing schedule until 2030, with several table stakes still to be solved by mid 2026
